TRANSLYFT produces lifting tables for Riksdagshuset (Swedish Parliament) in Stockholm

They needed two sets of lifting tables to use in the post sorting department, which should be able to lift post trolleys, post pallets and other kind of goods into the building.

The trolleys and pallets are different shapes and sizes, so it must be possible to use the lifting tables in both situations.

In close collaboration with the personnel at Riksdagshuset, TRANSLYFT has constructed a super low lifting table with two lifting functions in one. It has a switch mounted on the hand control box so the employees can change between the two functions.

The lifting tables are lowered into the floor, so when they are in the lowest position they are at floor level. The power units are mounted on the wall so they don't take up space on the floor.

An ergonomic, efficient and space-saving solution.
